

My learning experiance

Legacy User, Sunday 13 July 2008 - 10:38:02

I am currently learning C++, which is a very hard coding language. I am currently doing the basics which are console programs (the black boxes that have text in them). After I learn C++ I will go onto an easier language based off of C++ which is C#, then I will learn visual basic which is also based off C++, but Visual Basic is a nifty coding language that lets me make really cool stuff.

"Now why start with C++, why not start with something easier." says the curious reader. The answer is because almost every coding language is based off of C++ which means they are all like C++, so if I start with C++ I will already know part of all those coding languages because they're made from C++!

But console's are easy, I'm going to have trouble when I get to graphical stuff.
